1 Problem Statement

Universities manage large campuses with multiple buildings, labs, hostels, classrooms, and administrative offices. Daily operational issues such as electrical faults, plumbing leaks, IT disruptions, lab equipment failures, and safety concerns are commonly reported through informal channels like phone calls, emails, or verbal communication.

These methods result in delayed responses, lack of accountability, poor prioritization of urgent issues, and no centralized record of requests or resolutions. Students and staff are often unaware of the progress of their reported issues, while management lacks visibility into workload, performance, and recurring problems.

A centralized Work Order Management System is required to streamline the reporting, approval, assignment, and tracking of maintenance and service requests within the university.

2 Objectives

The objective of this project is to design and implement a centralized system that efficiently manages work orders across the university.

Project success will be measured by:

- Reduced average time to resolve reported issues
- Clear visibility of work order status for all users
- Accurate assignment of tasks to responsible staff
- Proper handling of urgent and safety-critical issues
- Improved accountability through tracked workflows

3 Stakeholders

- Students
- Faculty members
- Administrative staff

4 Operating Environment

The system will be accessible through a web-based interface that is responsive and compatible with mobile devices.

5 Functional Requirements

- Work order creation and categorization
- Location-based issue reporting
- Priority and urgency handling
- Approval and rejection workflows
- Task assignment and reassignment
- Work order status tracking
- Role-based access control
- Notifications on status changes
- Work order history and audit trail

6 Non-Functional Requirements

6.1 Usability

- The system shall be usable on both desktop and mobile devices.
- Users shall be able to submit a work order within 2 minutes.

6.2 Performance

- The system shall respond to user actions within an acceptable time under normal usage.

6.3 Security

- Users shall only access functions permitted by their role.
- Work order data shall not be accessible to unauthorized users.

6.4 Reliability

- The system shall preserve work order data in case of unexpected interruptions.

7 Features

The course project will implement a functional prototype (MVP) with the following features:

Implemented Features

1. User authentication and role-based access
2. Work order creation with category, location, and description
3. Approval workflow by the supervisor
4. Task assignment to service staff
5. Work order lifecycle management
 - Open
 - Assigned
 - In Progress
 - Complete
 - Close
6. Priority handling (higher priority orders appear first)
7. Status tracking for requesters

8 System Workflows

Maintenance Request Workflow

1. Student raises a maintenance request
2. Supervisor reviews and approves
3. Task is assigned to a technician
4. Supervisor updates progress

5. Work order is closed

All system workflows are consistent across different types of work orders.

9 Modules

- User Management Module
- Work Order Management Module
- Approval & Assignment Module
- Notification Module
